Applicant's remarks are as follows: 1) The Dohle reference fails to disclose that the second flow path has an inlet into which air is introduced and that the effluent is directed to the porous sheet without being mixed with the air, and 2) Grot reference fails to disclose that "the effluent discharged from said anode is passed through said porous sheet and discharged from said outlet". The Dohle reference clearly discloses an inlet for where air is introduced as shown in Figure 1 and discussed in the office action. The Applicant's assertion that because the second flow path provides oxygen for the cathode of the fuel cell, the effluent from the anode is mixed with air is incorrect. It is well known and obvious to one of ordinary skill that the oxidant flow path for a fuel cell is separate from the fuel supply path and would not intersect. As discussed previously in the office action Dohle is silent towards a porous sheet provided for the cleaning device on the waste line (2). Dohle further discloses the anode waste gas comprises primarily CO2, water vapor, and alcohol [0020]. The Grot reference is provided to teach the use of diffusion layers on catalysts (electrodes, cleaning device) to permit diffusion and dispersion of reactant gas to the catalyst layers. The apparatus of Dohle modified by the teachings of Grot would meet the limitations of the claim since the effluent provided in the waste line would pass through a diffusion layer of the purifying device before being discharged.
